Basic Payroll System

Final Project

Francisco Acosta | CEIS209 | June 2024

Introduction

This project build consisted of creating an application for a basic payroll system that tracks information for employees and pays them according to their associated outputs dictated by user input.

Employee information consists of their names, social security numbers, hire dates, health insurance, life insurance, vacation days and employee type, which is either hourly or salary. Hourly employees have their hourly pay and hours worked tracked, while salary employees have their annual salary charted.

The programming language of choice is C# and Microsoft Visual Studio is the integrated development environment utilized.

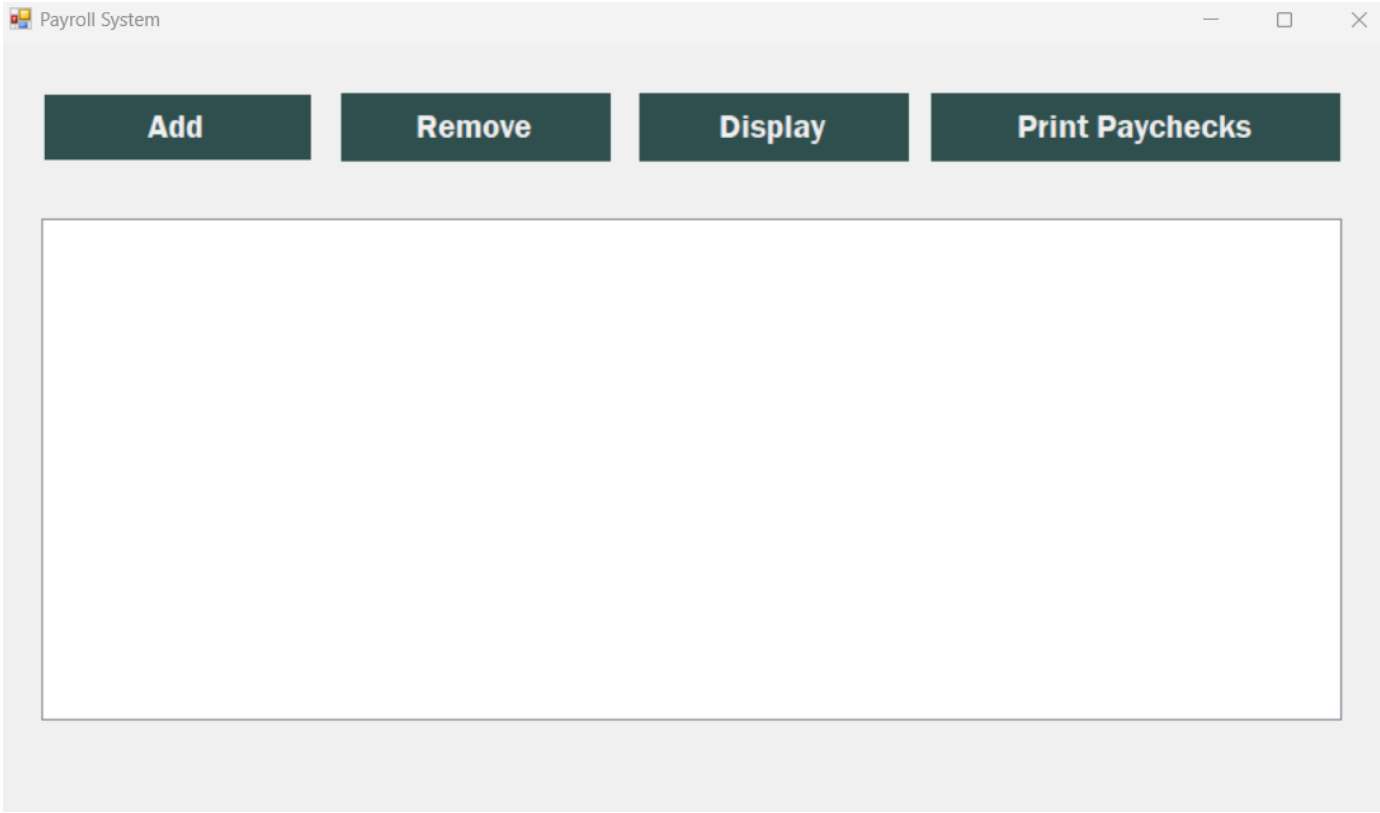

The goal was to provide a basic outline of a payroll system with the goal of securing each employee's sensitive information through data hiding.

Main Form

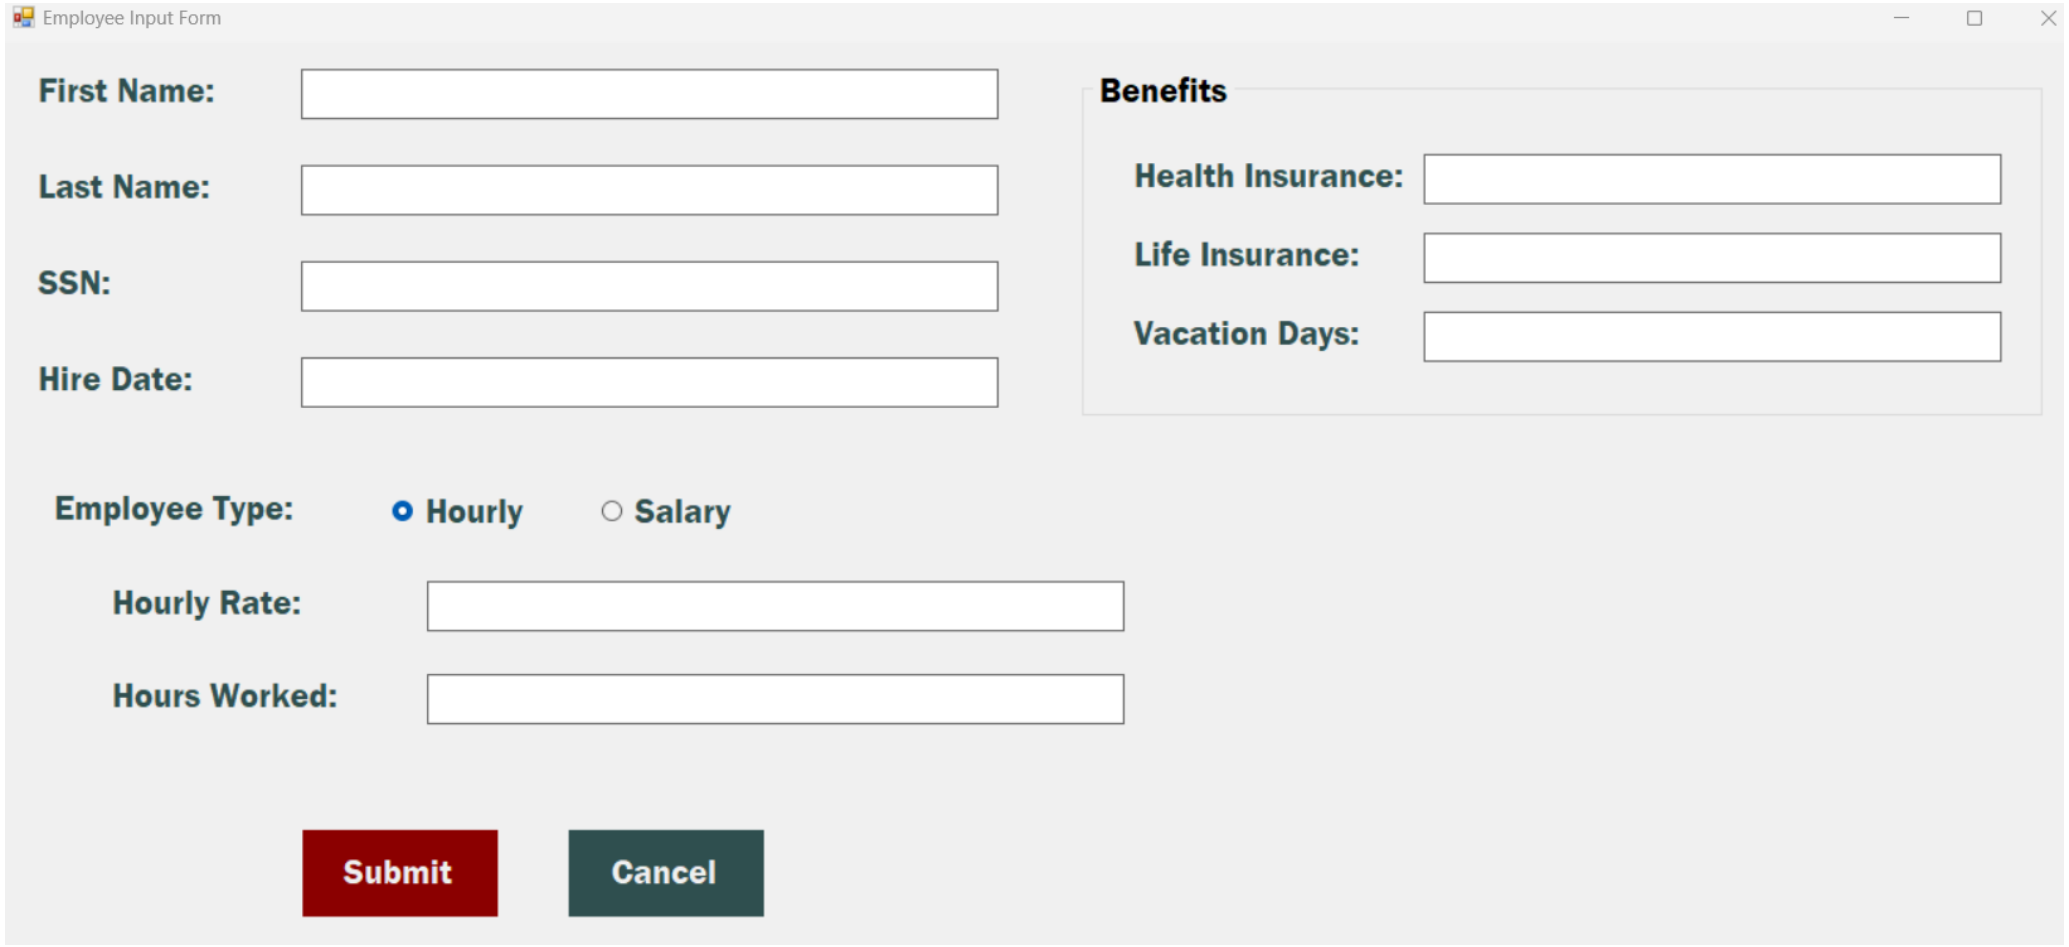

The main form serves as the entry point to the application.

It allows for a user to add or remove employees.

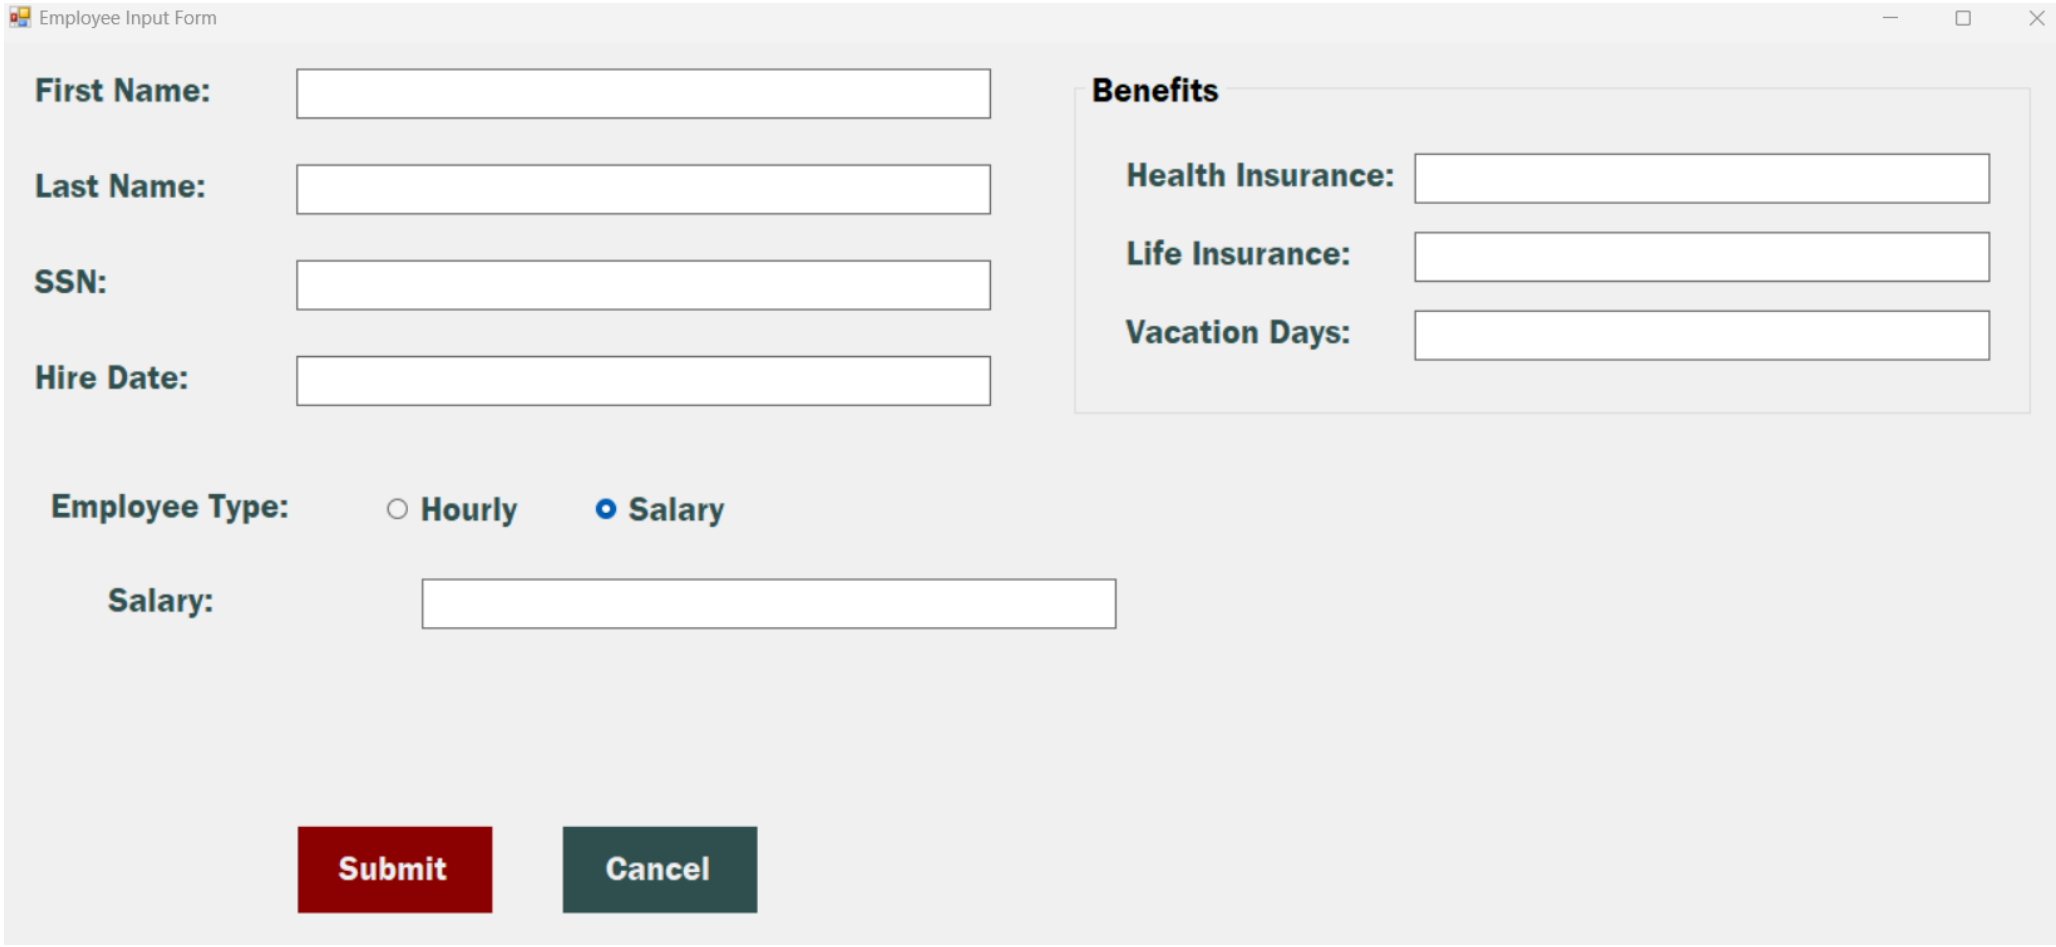

It also allows a user to display all employees and print their associated paychecks.

Input Form for Hourly Employees

Input Form for Salary Employees

Printing Paychecks
